## Summary

PyMC-Marketing is a comprehensive Python library implementing Bayesian marketing analytics, built on PyMC (Salvatier et al., 2016). Commercial marketing analytics tools typically provide limited transparency into their models, while open-source alternatives like Meta's Robyn and Google's Meridian focus primarily on media mix modeling (Google Inc., 2023; Meta Platforms Inc., 2022). PyMC-Marketing provides a unified framework spanning multiple marketing domains, including: Media Mix Modeling, Customer Lifetime Value analysis, Bass Diffusion Models, and Customer Choice Models. All outputs include full posterior distributions rather than point estimates, enabling explicit risk assessment in business decisions.

## Statement of Need

Marketing organizations struggle to attribute sales outcomes to specific marketing activities across multiple touchpoints and delayed conversion effects. Existing solutions suffer from: (1) black-box proprietary models with limited customization; (2) oversimplified approaches failing to capture marketing dynamics; and (3) lack of uncertainty quantification for high-stakes decisions.

PyMC-Marketing addresses these gaps by bridging marketing science research and practical applications. It operationalizes advanced Bayesian methods—hierarchical modeling, experimental calibration, and uncertainty quantification—within a user-friendly, scikit-learn compatible API. Key innovations include time-varying coefficients using modern Gaussian process approximations optimized for marketing contexts, and a novel experimental calibration framework that integrates lift test results directly into model likelihood. While frequentist approaches like Robyn provide bootstrap-based intervals, all PyMC-Marketing outputs include full Bayesian posterior distributions, enabling decision-makers to assess risk explicitly.

## Installation and Dependencies

PyMC-Marketing is available via conda-forge and pip. Core dependencies include PyMC (5.0), NumPy, Pandas, ArviZ (Kumar et al., 2019), and scikit-learn. Optional dependencies enable GPU acceleration (JAX), advanced samplers (NumPyro, Nutpie), and production deployment (MLflow (Zaharia et al., 2018), Docker).

## Key Features

PyMC-Marketing provides four distinct modules addressing comprehensive marketing analytics:

36 **1. Media Mix Modeling (MMM):** Multiple adstock functions, saturation curves, time-varying  
37 parameters via HSGP (Solin & Särkkä, 2020), experimental calibration for causal inference,  
38 budget optimization with business constraints, time-slice cross-validation, and marginal effects  
39 analysis (Arel-Bundock et al., 2024).

40 **2. Customer Lifetime Value (CLV):** BTYD models (Fader & Hardie, 2020) including BG/NBD,  
41 Pareto/NBD, and Gamma-Gamma frameworks with hierarchical extensions and individual-level  
42 uncertainty.

43 **3. Bass Diffusion Models:** Product adoption forecasting (Bass, 1969) with flexible parameteri-  
44 zation for innovation and imitation effects across multiple products.

45 **4. Customer Choice Models:** Discrete choice analysis (Train, 2009) based on random utility  
46 theory, including multinomial logit and multivariate interrupted time series models.

47 **Production Ready:** All modules feature MLflow (Zaharia et al., 2018) integration, Docker  
48 containerization, multiple MCMC backends (NumPyro (Bingham et al., 2019), Nutpie (Seyboldt  
49 & PyMC Developers, n.d.)), variational inference (ADVI), MAP estimation, data connectors  
50 (e.g., Fivetran), and comprehensive diagnostics via ArviZ.

## 51 Key Advantages

52 PyMC-Marketing provides uncertainty quantification through full posterior distributions, exper-  
53 imental calibration anchoring observational models to causal ground truth, and flexible budget  
54 optimization with business constraints. The scikit-learn compatible API ensures seamless  
55 integration into existing data science workflows. The library has been successfully deployed by  
56 companies including HelloFresh and Bolt for production marketing analytics. Comprehensive  
57 tutorials, example notebooks, and video resources are available in the online documenta-  
58 tion at <https://www.pymc-marketing.io/en/stable/>, with community support from over 70  
59 contributors and translations in Spanish.

## 60 Community Guidelines

- 61 ■ **Issues:** Report bugs and feature requests on [GitHub](#)
- 62 ■ **Discussions:** Join community discussions on [GitHub Discussions](#)
- 63 ■ **Documentation:** Comprehensive guides and tutorials available at [pymc-marketing.io](https://pymc-marketing.io)
- 64 ■ **Contributing:** See [CONTRIBUTING.md](#) for development guidelines
- 65 ■ **Support:** Professional consulting available through [PyMC Labs](#)

## 66 Funding

67 PyMC-Marketing is a community-driven project built primarily through volunteer contributions  
68 from over 70 developers. Some contributions by PyMC Labs affiliates have received partial  
69 funding.

## 70 Acknowledgments

71 We acknowledge the PyMC development team for the foundational probabilistic programming  
72 framework and the broader PyData ecosystem contributors. Special recognition goes to  
73 the marketing science research community for developing the theoretical frameworks that  
74 PyMC-Marketing operationalizes (Bass, 1969; Fader et al., 2005; Jin et al., 2017; Train, 2009).
